PSTAT 5A / **MIDTERM EXAM 2** / Sum. Sess. A 2023   Instructor: **Ethan Marzban**

Name:_____   **UCSB NetID:**_____
        First, then Last   *NOT your Perm Number!*

Circle Your Section: Olivier 12:30 - 1:20pm   Mengrui 2 - 2:50pm   Mengrui 3 - 3:50pm

MULTIPLE CHOICE QUESTIONS   VERSION A

Instructions:

- You will have **75 minutes** to complete the entire exam
    - Do not begin working on the exam until instructed to do so.
    - During the final 10 minutes of the exam, we will ask everyone to remain seated until the exam concludes.

- This exam comes in **TWO PARTS**: this is the **MULTIPLE CHOICE** part of the exam.
    - There is a separate booklet containing Free-Response questions that should have been distributed to you at the same time as this booklet.

- Fill in the bubble corresponding to your answer **on the provided scantron**; **Absolutely NOTHING** written directly on this exam booklet will be graded. Partial credit will **not** be awarded.
    - Unless explicitly instructed otherwise, mark only one answer per question. If you mark multiple answers for the same question, you will receive 0 points for the question even if one of your choices is correct.

- The use of calculators is permitted; the use of any other aids (including notes, laptops, phones, etc.) is strictly prohibited. A list of formulae, as well as a collection of tables, is included with this exam.

- PLEASE DO NOT DETACH ANY PAGES FROM THIS EXAM.

- Good Luck!!!

Problems 1 - 4 refer to the following stiuation: Alan would like to plot the function $f(x) = xe^{-x^2}$, between $x = 0$ and $x = \pi$. To that end, he has written the following code, and has nothing written before it:
```
%matplotlib inline
import matplotlib
import matplotlib.pyplot as   _Blank 1_
plt.style.use('seaborn-v0_8-whitegrid')

  _Blank 2_   numpy   _Blank 3_   np

def f(x):
    """
    return x * e^(-x^2)
    """
    return x * np.exp(- (x ** 2))

xnew = np.linspace(0, np.pi, 7)
plt.plot(xnew, f(xnew));
```

This code, after filling in the blanks appropriately, has resulted in the following output:

Problem 1. What should go in Blank 1?   [1pts.]

    A. `matplotlib.pyplot`

    B. `pyplot`

    C. `plt`

    D. `mtpltlbpplt`

    E. None of the above

Problem 2. What should go in Blank 2?   [1pts.]

    A. `import`

    B. `load`

    C. `store_module`

    D. `*`

    E. None of the above

Problem 3. What should go in Blank 3? [1pts.]

     A. `*`

     B. `as`

     C. `if`

     D. `elif`

     E. None of the above

Problem 4. Note that the resulting plot is quite "jagged." Alan would like to [1pts.] fix that, and make the resulting plot smoother <u>without</u> changing the $x-$ and $y-$limits of the plot. Which of the following will achieve that?

     A. Change the `np.pi` in his call to `np.linspace()` to a larger number; e.g. `100`.

     B. Change the `0` in his call to `np.linspace()` to a larger number; e.g. `100`.

     C. Change the `7` in his call to `np.linspace()` to a larger number; e.g. `100`.

     D. None of the above

....

Problems 5 - 8 refer to the following situation: Shivani would like to write a function called `num_even()` that takes in a single list input `x` and returns the number of even elements in `x`. She has written the following skeleton code (assume she has nothing written before this code):

```
def num_even(x):

    """
    return the number of even elements in a list x
    """

    count = __Blank 1__

    for k in x:

        if __Blank 2__ % 2 == 0:

            __Blank 3__ += 1

        else:

            count += 0

    return __Blank 4__
```

Problem 5. What should go in Blank 1? [1pts.]

    A. `0`

    B. `1`

    C. `2`

    D. `3`

    E. None of the above

Problem 6. What should go in Blank 2? [1pts.]

    A. `x`

    B. `k`

    C. `count`

    D. `even_count`

    E. None of the above

Problem 7. What should go in Blank 3? [1pts.]

    A. `x`

    B. `k`

    C. `count`

    D. `even_count`

    E. None of the above

Problem 8. What should go in Blank 4? [1pts.]

    A. `x`

    B. `k`

    C. `count`

    D. `even_count`

    E. None of the above

....

Problems 9 - 11 refer to the following situation: Consider the random variable X with the following probability mass function (p.m.f.):

k	-1	0	1	2
$\mathbb{P}(X = k)$	0.2	0.5	0.05	a

for some as-of-yet unknown constant a.

Problem 9. What must be the value of a?   [1pts.]

      A. 0.15

      B. 0.25

      C. 0.50

      D. 0.75

      E. None of the above

Problem 10. Suppose $a = 0.25$ (which is not to say this is the correct answer to   [1pts.]
Problem 9 above!) What is the value of $\mathbb{E}[X]$, the expected value of X?

      A. 0.05

      B. 0.15

      C. 0.25

      D. 0.35

      E. None of the above

Problem 11. Suppose $a = 0.25$ (which is not to say this is the correct answer to   [1pts.]
Problem 9 above!) and that $\mathbb{E}[X] = 0.35$ (which is not to say this is the correct
answer to Problem 10 above!) What is $\text{Var}(X)$?

      A. 1.1275

      B. 1.2500

      C. 1.3725

      D. 1.6000

      E. None of the above

....

Problems 12 - 15 refer to the following stiuation: Suppose that Mehr has imported
the `scipy.stats` module with the nickname `sps`, and also imported the `numpy`
module with the nickname `np`.

Problem 12. Approximately what value would be returned by the running the   [1pts.]
command `sps.norm.ppf(0.0351)`?

      A. -1.81

      B. -2.11

      C. 1.81

      D. 2.11

      E. None of the above

Problem 13. Approximately what value would be returned by the running the   [1pts.]
command `sps.t.cdf(1.33, df = 20)`?

      A. 0.010

B. 0.100

C. 0.200

D. 1.330

E. None of the above

Problem 14. Suppose Mehr runs the command [1pts.]

```
np.random.choice(np.arange(7), size = 10)
```

Which of the following best describes what this code is doing?

    A. Simulates rolling a 7-sided die once

    B. Simulates rolling a 6-sided die once

    C. Simulates rolling a 10-sided die 7 times

    D. Simulates rolling a 6-sided 10 times

    E. None of the above

Problem 15. Suppose Mehr now runs the following lines of code: [1pts.]

```
a = sps.norm.ppf(0.1)
b = sps.norm.ppf(0.9)
```

Which of the following correctly describes the relationship between the values of a and b?

    A. a = 1 - b

    B. b = 1 - a

    C. a = -b

    D. a + b = 1

    E. None of the above.
